

The Mississippi Mills Residents' Association (MMRA) presents:

Nuclear River or Bad Science?

What you need to know about uranium mining on the Mississippi Watershed

Date/Time: Friday, October 12, 2007, 7:30 pm

Location: Almonte United Church Social Hall, Elgin Street, Almonte

Cost: No admission charge – free-will offering gratefully accepted.

Session overview:

This is a moderated information session which will include three perspectives as well as a chance for questions and answers. This uranium mining issue is proving to be a complicated and emotionally-charged debate in which many residents of Mississippi Mills are deeply engaged. The topic has been the subject of several news items of late. This moderated session will allow audience members to clarify their understanding of the issues and pose questions to the speakers.

Speakers:

Mr. John Kittle MSc has 2 years experience in nuclear physics research at Carleton University. As a resident of North Frontenac he will present his understanding about the dangers and consequences of proposed mining operations on the health of the Mississippi Watershed.

Mr. George White, President of Frontenac Ventures Corporation, the company that is seeking to proceed with uranium mining operations, will provide arguments that support FVC's position that this uranium mining project is a legally- and environmentally-defensible corporate pursuit.

Mr. Paul Lehman, General Manager, Mississippi Valley Conservation Authority will provide the Conservation Authority's understanding of the proposed mining project and discuss the possible environmental issues.

Prof. Don Wiles, of Carleton University's Department of Chemistry, will moderate the discussion.
